## Introduction

Orth-Rodgers \& Associates, Inc. (ORA) was selected by the South Jersey Transportation Planning Organization (SJTPO) to conduct their 2011-12 Road Safety Assessment (RSA) project. The sections of roadway to be studied were selected by SJTPO based on a number of factors considered important to the safety and future development of the roadways. Among the factors considered were crash data, traffic volume growth, recent and planned future development along the roadway, and local cooperation and control. County and local officials cooperated with the SJTPO in identifying roads that meet these parameters.

Three roadway sections and 15 signalized intersections were chosen for the 2011-12 assessments. Two of the roadways are located in Atlantic County, one is in Cape May County and the 15 signalized intersections are located in Cape May County.

The three roadway sections are:

1. Brigantine Avenue (CR 638) entire length, between RT 87 and its northern terminus north of $14^{\text {th }}$ Street in The City of Brigantine, Atlantic County.
2. Ventnor Avenue (CR 629), between Coolidge Avenue in Margate City and Dorset Avenue in Ventnor City, Atlantic County.
3. New Jersey Avenue (CR 621) between Rambler Road (MP 4.19) and Cresse Road (MP 5.05) and between Young Avenue (MP 5.70) and $26^{\text {th }}$ Street (MP 6.37) in Wildwood Crest Borough and Wildwood City, Cape May County.

The 15 signalized intersections are:

1. Central Avenue and $16^{\text {th }}$ Avenue in the City of North Wildwood
2. The following locations in the city of Wildwood:
a. New York Avenue and Maple Avenue (flashing beacon)
b. Atlantic Avenue and Glenwood Avenue
c. Ocean Avenue and Cresse Avenue
d. Atlantic Avenue and Cresse Avenue
e. Atlantic Avenue and Hand Avenue
f. Atlantic Avenue and Taylor Avenue
g. Atlantic Avenue and Montgomery Avenue
h. Atlantic Avenue and Schellenger Avenue
i. Atlantic Avenue and Oak Avenue
j. Atlantic Avenue and Wildwood Avenue
k. Atlantic Avenue and Magnolia Avenue
3. Atlantic Avenue and $26^{\text {th }}$ Street
m. Pacific Avenue and Baker Avenue
n. Pacific Avenue and Spencer Avenue
o. Central Avenue and $16^{\text {th }}$ Avenue

Each studied roadway will have a separate report, but will share basically the same introduction, background section, format and some text.

Safety assessments serve to address the safe operation of the roadways and to ensure a high level of safety for all road users. The process of a safety assessment is two-fold: 1) to conduct a formal examination of highway features and the surrounding environment that increases the potential for crashes; and, 2) to identify countermeasures that will reduce or eliminate the probability of such crashes. According to the Federal Highway Administration (FHWA), the formal definition of a road safety assessment is as follows:

## "A Road Safety Audit is the formal safety performance examination of an existing or future road or intersection by an independent, multidisciplinary team."

To accomplish these goals, the assessment team assesses the safety performance history as well as the future crash potential of a roadway and prepares a report that documents the safety deficiencies and appropriate countermeasures. The purpose of the 2011-12 assessment is to identify potential safety deficiencies along the selected sections of the three roadways and at the 15 signalized intersections.

There are three primary parts of the assessment: 1) the data collection and analysis phase; 2) the field view (conducted by the team); and, 3) the preparation of the report and findings.

The data collection phase is performed prior to the assessment team conducting a field view of the entire roadway. The data is intended to assist the team in identifying potential safety issues, as well as to provide a factual and historic component of the study. Traffic count and crash data are collected, and a capacity analysis of major intersections is performed. The traffic counts are used to assist in analyzing solutions for the intersections, as well as aid in identifying the most congested sections of the roads. The crash data assists the team in identifying specific areas and/or conditions that warrant close scrutiny that might have otherwise been overlooked. The capacity analysis of intersections identifies how well the intersections are operating and when and where improvements may be needed. Based on an analysis of all of the data, the team can conduct a productive and comprehensive evaluation of the roads being studied. A multidisciplinary team conducts the field view.

The team divided into two groups with one group walking the northbound side of the road and the other the southbound side of the road starting at RT 87 and walking north to $14^{\text {th }}$ Street discussing observations and taking notes for inclusion in the report. The team leader then prepared a draft report that documented the assessment findings and recommended actions. The draft report is distributed to the team members for their review and comment. A final report is then prepared by the team leader incorporating the agreed upon draft report comments.

## BACKGROUND INFORMATION

At the pre-assessment meeting a list of questions were asked of the County and local representatives seeking to gather background information on Brigantine Avenue ( CR 638). The questions asked were:

- Why was the road chosen for the assessment?
- What problems exist on the road?
- What areas should be given special attention?
- Has the roadway changed in the last three years?
- Are there any projects pending or anticipated for the roadway and their status?
- Have any of the traffic control devices or regulations been changed in the last three years (i.e., signals, speed limits, etc.)?
- Was there any development on the road in the last three years, or any proposed development on the road or in the area that has or will impact traffic in the future?
- Are any recent traffic counts available?
- Have any recent traffic studies been conducted on the road?
- What plans, if any, are available for the road?
- At what locations should new traffic counts, either turning movement or ATRs, be conducted?

The same questions were again asked at the workshop on the day of the assessment to ensure that no available data was missing. A pre-assessment information package was prepared and distributed at the workshop and field view. The package included a brief explanation of what a safety assessment is, why safety assessments are conducted, and the process involved. It also included a chart of three year crash trends, crash occurrence by month, by day of the week, by time of day, by surface condition, by light condition, by crash severity, by crash type, and by closest intersection.

## BRIGANTINE AVENUE (CR 638)

Brigantine Avenue (CR 638) is under the jurisdictional control of Atlantic County. The entire length of the road is in the City of Brigantine, Atlantic County. The Road Safety Assessment was performed over its entire length.

CR 638 (Brigantine Boulevard) is designated as a south to north roadway and is classified as an urban principal arterial. It starts at the northern terminus of RT 87 (MP 0.0) at the north end of the bridge over Absecon Channel and extends north approximately 3.91 miles, where it dead ends. From milepost 0.0 to approximately milepost 1.2, it is a four lane divided roadway with shoulders and left turn slots created in the grass center median. Parking is permitted along both shoulders of the road and the posted speed limit is 45 MPH. Between milepost 0.3 and Harbor Beach Boulevard (MP 1.0), there is a service road along the northbound side of the road whose primary function is to provide access to the properties along the east side of the road.

Just north of Harbor Beach Boulevard (MP 1.0), the roadway becomes undivided and remains undivided for its duration, although its lane configuration varies. Basically, it is a four lane undivided roadway into a traffic circle at milepost 1.53, then transitions to one lane in each direction north of the circle with a posted 35 MPH speed limit. In the vicinity of $30^{\text {th }}$ Street (MP 1.73), it becomes a four lane undivided roadway with painted bike lanes along both sides of the road. From $18^{\text {th }}$ Street (MP 2.3), to its northern terminus, it has a three lane configuration consisting of a through lane in each direction and a center left turn lane with painted bike lanes along both sides of the road adjacent to the through lanes and shoulders along both sides of the road. The speed limit along the three lane section is 30 MPH . There are pedestrian refuge islands in the center of the roadway at its intersection with $24^{\text {th }}$ and $26^{\text {th }}$ Streets. There are three traffic signals along the roadway, at Harbor Beach Boulevard, at $38^{\text {th }}$ Street, and at $14^{\text {th }}$ Street.

There are no significant traffic generators along the road other than the typical assortment of shore resort generators such as motels, restaurants, small shops, some service businesses and, of course, the beach.

It was ascertained from local members of the assessment team that:

- The road was chosen to be assessed because of the substantial increase in traffic during the summer resort months including pedestrians and bicyclist. Also, the traffic signal equipment is dated and worn and not pedestrian friendly. Vehicle speeds are high at the south end of the road within the four lane divided section in the vicinity of Route 87.
- There are no projects of significance planned for the road.
- There have been no significant changes along the road in the last three years.
- There have been no significant changes to the traffic controls along the road in the last three years.

The following sections describe the various tasks undertaken by ORA in partnership with the Safety Assessment Team and summarize the findings from the assessment process in a manner that will allow the responsible agencies and personnel to prioritize implementation of safety enhancements.

## Pre-Assessment Data Collection and Analysis

Prior to the assessment activities on site, ORA collected and reviewed materials in order to assist the team in conducting the assessment. ORA also conducted a pre-assessment field view of the road to familiarize itself with the road. A description of the materials that were reviewed is provided below.

## 1. Traffic Volume Data

Since the road is located within the summer resort area of the state the County requested that traffic counts be conducted during the summer months, therefore they were not available prior to conducting the field view. Eight-hour weekday traffic counts were conducted at the Harbor Beach Boulevard and $38^{\text {th }}$ Street intersections with Brigantine Boulevard (CR 638). Also, 10AM-2 PM Saturday traffic counts were taken at both of the intersections. GTS consultants conducted the eight hour counts on July 26, 2011 and July 27, 2011 and the 10AM-2PM counts on July 23, 2011.

## 2. Crash Data

SJTPO forwarded to ORA the crash data excel files for the roadway being studied. Crash data for the years 2008, 2009 and 2010 were reviewed. A summary sheet, crash data summary text, and crash data charts were prepared for use during the pre-assessment meeting.

## CRASH DATA SUMMARY

During the kickoff meeting with the County it was learned that SJTPO would provide the crash charts for the section of roadway being assessed. It was agreed that a straight line diagram plot of the crash data would not be required. In the three year period (2008-2010), a total of 90 crashes occurred along the study section of road. Twenty nine (29) crashes occurred in 2008, twenty four (24) in 2009 and thirty seven (37) in 2010. In the preceding 5 -year period there were a total of 158 crashes, averaging 32 per year, with a low of 19 in 2006 and a high of 39 in 2007.

The types of crashes are characterized as follows: a concentration of crashes for reference in this report will consist of three (3) or more crashes of the same type at a location in the three (3) year period, 2008-2010. The table on the following page summarizes the crash data by type of crash and location:

| \# of Crashes | Type of Crash | Location of Crashes |
| :---: | :---: | :---: |
| 0 | Fatal Crashes |  |
| 25 | Injury Crashes |  |
| 65 | Non-Injury Crashes |  |
| 15 | Right Angle Type Crashes | (6) at Harbor Beach Boulevard No other concentrations |
| 26 | Same Direction Crashes | (6) at Harbor Beach Boulevard <br> (5) at North $4^{\text {th }}$ Street <br> (3) at South $14^{\text {th }}$ Street <br> No other concentrations |
| 4 | Left Turn Type Crashes | No concentration |
| 11 | Side Swipe Same Direction Type Crashes | No concentration |
| 1 | Side Swipe Opposite Direction Type Crashes | Vicinity of Bayshore Avenue |
| 13 | Fixed Object Type Crashes | (5) in the vicinity of Harbor Beach Boulevard <br> No other concentrations |
| 1 | Head-On Type Crash | Vicinity of Bayshore Boulevard |
| 3 | Pedestrian Type Crashes | (1) at South $10^{\text {th }}$ Street, (1) at South $15^{\text {th }}$ Street, (1) at South $16^{\text {th }}$ Street |
| 6 | Bicyclist Type Crashes | (2) at Roosevelt Boulevard, (1) at South $7^{\text {th }}$ Street, (1) at South $9^{\text {th }}$ Street, (1) at South $14^{\text {th }}$ Street, (1) at South $28^{\text {th }}$ Street |
| 2 | Other Type Crashes | Backing |
| 8 | Struck Parked Vehicles | No concentrations |

The crash data was compared to the "Crash Summary For County Road System" obtained from the NJDOT for the year 2009.

A review of the crashes established the following:

- The month with the most crashes, as expected since the roadway is in the summer resort area of the state, was July (16).
- The day of the week with the highest number of crashes was Saturday (17) and Monday and Tuesday were the days with the least number of crashes (10 each).
- The highest frequency of crashes (14) occurred between 2:00-3:00 PM, which corresponds generally to the time people are leaving the beach for the day.
- The percentage of crashes during hours of darkness (21\%) is less than the statewide average for county roads (approximately 27\%).
- The percentage of crashes for wet surface conditions (12\%) is less then the statewide average for county roads (approximately 22\%).
- The percentage of crashes with injuries (28\%) is approximately the same as the statewide average for county roads (approximately 28\%).
- The percentage of right angle type crashes (17\%) is approximately the same as the statewide average for county roads (approximately 19\%).
- The percentage of same directional crashes (29\%) is approximately the same as the statewide average for county roads (approximately 32\%).
- The percentage of left-turn crashes (4 \%) is approximately the same as the statewide average for county roads (approximately 5\%).
- The percentage of side- swipe same direction type crashes (12 \%) is approximately the same as the statewide average for county roads (approximately 11\%).
- The percentage of fixed-object type crashes (14\%) is approximately the same as the statewide average for county roads (approximately 12\%).
- The percentage of head on crashes (1\%) is less than the statewide average for county roads (approximately 3\%).
- The percentage of pedestrian type crashes (3\%) is approximately the same as the statewide average for county roads (approximately 2\%).
- The percentage of bicycle type crashes (7\%) is much higher than the statewide average for county roads (approximately 1\%). This is not surprising due to the beach destination.
- The percentage of struck parked vehicle type crashes (9\%) is higher than the statewide average for county roads (approximately 6\%)

## Assessment

On July 7, 2011 the Safety Assessment Team met in the Brigantine City municipal building to formally conduct the assessment. The meeting commenced at 9:00 AM with brief statements by ORA representatives who reiterated the importance of RSAs and outlined the objectives of the safety assessment. There were brief introductions by team members followed by an extensive review and discussion of materials described in the previous section. The team then drove to the southern end of Brigantine Boulevard (CR 638) to begin the assessment. Atlantic County provided a van for the team. Team members are listed below.

## SAFETY ASSESSMENT TEAM FOR BRIGANTINE AVENUE

| Name | Agency |
| :--- | :--- |
| John Masi | Atlantic County |
| James Mason | Atlantic County |
| John Peterson | Atlantic County |
| Jennifer Marandino | SJTPO |
| John Everest | Atlantic County |
| Edward Newman | Atlantic County |
| Lt. James Bennett | Brigantine Police |
| Sheree Davis | NJDOT |
| Thanh Le | Rutgers TCRC |
| John Gaona | GTS Consultants |
| Andy Kaplan | Rutgers |
| Teresa Thomas | South Jersey Traffic Safety Alliance |
| Norman Deitch | Orth-Rodgers \& Associates, Inc. |
| George Strathern | Orth-Rodgers \& Associates, Inc. |

Additionally, Mr. Timothy Chelius and Mr. John Petersack of SJTPO attended the preassessment meet but did not participate in the field view portion of the assessment. The team split up into two groups, one walking on the northbound side of the road lead by Mr. Strathern and the other walking the southbound side lead by Mr. Masi. The team walked the entire length of the road to its’ northern terminus.

During the field views, team members identified features on the roadway and its surrounding environment that could contribute to the occurrence or relative severity of roadway crashes. At the intersections and mid-block locations, the Assessment Team identified safety deficiencies and inappropriate traffic signs, as well as other items that were felt to be inconsistent with effective road function and use. A variety of safety improvement measures were discussed with field notes and digital photographs being taken by team members.

At the completion of the assessment, the team leader recapped the findings of the assessment with the team. The team leader informed the team members on the next step in the assessment process; ORA will prepare a draft report summarizing the findings from the assessment process and forward the report to all team members for their review and comments.

On November 3, 2011 Norman Deitch, John Masi, Matthew Hash (Atlantic County), Jennifer Marandino and George Strathern conducted a night assessment. The goal was to check the retroflectivity of the street signs, pavement markings, and condition of the raised pavement markers (RPMs). In addition, the need for street lighting was checked and lights adjacent to the roadway on private property were checked to ensure that they did not create bright areas and glare that could distract drivers. The team also looked for issues that would only be apparent during hours of darkness, such as clearly defined roadway alignment, ineffective street lighting, etc.

The next section of the report summarizes the findings from the daytime and nighttime assessment of Brigantine Boulevard (CR 638) along with suggested remedial actions to address the noted safety issue. In order to assist in prioritizing the work effort recommended to correct the situation, the level of effort required (low, medium, high) and degree of safety benefit derived (low, medium, high) is also noted for each item.

## LEVEL OF EFFORT REQUIRED

For this road safety assessment final report the "level of effort" required to address a remedial action recommendation has been divided into three levels - low, medium and high. A correlation of cost and man hour expenditures generally helps to define the level of effort. The following are some examples of the levels of effort:

- Low Level of Effort - Development of general work orders or directives from the engineering department to its maintenance forces to: implement signal timing changes; pavement marking revisions and refurbishing; replacing worn signs; installing new signs; replacing a few rigid sign supports with breakaway supports; tree trimming.
- Medium Level of Effort - Minor revisions to a traffic signal not requiring any underground work; signal revisions that require re-wiring for new signal heads; installing pedestrian indications; replacing inlet grates; installing or repairing small sections of sidewalk and guiderail; installing corridor wide breakaway sign supports; restriping an entire roadway section; conducting more detailed in-house traffic studies to address specific issues.
- High Level of Effort - Major signal revisions requiring underground work such as new foundations, conduit, new signal controller; redesign of roadway features; resolving poor drainage issues; development of design plans that would require outside contractors to implement; any road work that would require permits and general capital improvement projects.

## POTENTIAL SAFETY BENEFITS

Potential safety benefits are divided into three categories - low, medium and high. This is a subjective breakdown based on engineer's opinion as to the percentage of the road that would be impacted by the improvement along with the degree of impact that the identified safety issue would have on potential crash experience. For example, eliminating a potential tripping safety hazard where there are very few pedestrians could be considered low, however, if they number of pedestrians was high the potential safety benefit would increase. Pavement markings not visible at night could be considered high.

## Findings

The findings from the Brigantine Boulevard (CR 638) safety assessment, except where repetitious items have been combined, are presented on the following pages in the approximate order of their location on the roadway starting at milepost 0 and proceeding to mile post 3.91.

|  |  |  | LEVEL OF EFFORT <br> REQUIRED |  | POTENTIAL SAFETY <br> BENEFIT |  |  |  |
| :---: | :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| SAFETY ISSUE | REMEDIAL ACTION | LOW | MEDIUM | HIGH | LOW | MEDIUM | HIGH |  |
| 1 | General comment- the pavement <br> markings along the entire <br> roadway are worn and need to be <br> re-painted | Re-install pavement markings. |  |  |  |  |  |  |
| 2 | General comment-many of the <br> RPM's along the entire length of <br> the road are damaged or missing. | Inventory damaged or missing <br> RPM's and replace as needed. |  |  | X |  |  |  |
|  | General comment-roadway <br> surface is deteriorated along the <br> lane line marking (old concrete <br> joint) along the section of road <br> between the southern terminus of <br> the road and Harbor Beach <br> Boulevard. (Picture \#1) | Consideration be given to <br> evaluate the pavement condition <br> and making the necessary repairs <br> to the pavement. |  |  |  |  | X |  |

## Picture \#1

CRACKS IN ROADWAY (NORTHBOUND)

| SAFETY ISSUE |  | REMEDIAL ACTION | LEVEL OF EFFORT REQUIRED |  |  | POTENTIAL SAFETY BENEFIT |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | LOW | MEDIUM | HIGH | LOW | MEDIUM | HIGH |
| 4 | General comment- there are some handicapped ramps along the roadway but most do not appear to be in compliance with ADA standards. Other locations lack them entirely. |  | Consideration be given to installing ADA compatible ramps along the roadway in conjunction with future roadway projects. |  |  | X |  |  | X |
| 5 | General comment - Sign installation. Many of the signs along the road are installed as "bendaway" rather than <br> "breakaway." Many installed as "breakaway" are installed incorrectly with the stub too far out of the ground or on the wrong side of the post. | Consideration should be given to inventorying the method of sign installation along the entire road and taking steps to properly install all signs as "breakaway" in accordance with the most current NJDOT standards and the MUTCD. |  |  | X |  | X |  |
| 6 | General comment - Most of the street name signs are worn to a point that they cannot be read especially at night. | Contact Brigantine officials regarding having new signs installed. |  |  | X |  |  | X |
| 7 | General comment- Oversized "NO PARKING" signs installed by the City are all installed on non-break-away posts. County officials have recommended that all of these signs be removed. | Remove all of the signs. | X |  |  | X |  |  |
| 8 | Northbound side- entering Brigantine-pedestrian activity and legal rights along the road should be highlighted. | Consideration should be given to installing a state law "Stop For Pedestrian in Crosswalk" sign or similar sign north of the first speed limit 40 MPH sign. | X |  |  |  | X |  |

| SAFETY ISSUE |  | REMEDIAL ACTION | LEVEL OF EFFORT REQUIRED |  |  | POTENTIAL SAFETY BENEFIT |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | LOW | MEDIUM | HIGH | LOW | MEDIUM | HIGH |
| 9 | Northbound side- approximately $1 / 4$ mile north of bridge- sewer vent foundation with concrete base approximately 12 inches above grade. (Picture \#2) |  | Consideration should be given to grading the surrounding area to reduce the exposed height of the concrete base | X |  |  | X |  |  |
| 10 | Northbound side- Brigantine garden club plate mounted on boulder by "SLOW DOWN WHATS YOUR HURRY YOU ARE ALREADY HERE" sign. Boulder is a possible road side hazard. (Picture \#3) | Consideration should be given to moving the boulder to the far side of the plantings farther from the roadway. | X |  |  | X |  |  |
| 11 | Northbound side-there are several left turn slots in the grass median. None have signs or pavement markings. (Picture \#4) | Consideration should be given to installing the appropriate signs and pavement markings for the left turn slots. | X |  |  |  | X |  |

Picture \#2

Picture \#3
Brigantine Garden Club

Picture \#4

|  |  | LOW | MEDIUM | HIGH | LOW | MEDIUM | HIGH |
| 87 | Southbound side-at S.32 ${ }^{\text {nd }}$ StreetSTOP sign obstructed by tree, no painted crosswalks at the intersection. |  | Trim tree to remove obstruction of STOP sign. Consideration be given to installing crosswalks at the intersection. | X |  |  | X |  |  |
| 88 | Southbound side- vicinity of S. $30^{\text {th }}$ Street- Pedestrian crossing warning sign obstructed by trees. | Trim trees to remove obstruction of sign or if more practical relocate sign. | X |  |  | X |  |  |
| 89 | Southbound side-vicinity of S. $39^{\text {th }}$ Street- lane drop lack a lane drop warning sign (W4-2) | Install lane drop warning sign at appropriate location. | X |  |  | X |  |  |
| 90 | Southbound side at S. $27^{\text {th }}$ Streetno painted crosswalks, no detectable warning surface on handicapped ramps. | Consideration be given to installing crosswalks at the intersection and to installing the missing detectable warning surface on the handicapped ramps. | X |  |  | X |  |  |
| 91 | Southbound side at S. $26^{\text {th }}$ Streetno detectable warning surface on the handicapped ramps. | Consideration be given to installing the detectable warning surface on the handicapped ramps. | X |  |  | X |  |  |
| 92 | Southbound side- between S. $15^{\text {th }}$ and S. $17^{\text {th }}$ Streets- Two way left turn lane lacks required accompanying signage. | Install appropriate signing identifying the two way left turn lane. | X |  |  | X |  |  |
| 93 | Southbound side- at S. $15^{\text {th }}$ Street- no pedestrian crossing warning sign. | Consideration be given to installing a pedestrian crossing warning sign. | X |  |  | X |  |  |

| SAFETY ISSUE |  | REMEDIAL ACTION | LEVEL OF EFFORT REQUIRED |  |  | POTENTIAL SAFETY BENEFIT |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | LOW | MEDIUM | HIGH | LOW | MEDIUM | HIGH |
| 94 | S.11 ${ }^{\text {th }}$ Street- no crosswalks to seawall access point. |  | Consideration be given to installing the appropriate painted crosswalk. | X |  |  | X |  |  |
| 95 | Southbound side-at S. $6^{\text {th }}$, S. $9^{\text {th }}$ and S. $10^{\text {th }}$ Streets- one way signs (R6-2) are worn. | Replace with new signs. | X |  |  | X |  |  |
| 96 | Southbound side at S.2 ${ }^{\text {nd }}$ StreetDip warning sign is worn. | Replace with new sign. | X |  |  | X |  |  |
| 97 | S. $3^{\text {rd }}$ Street- it was observed that there was significant pedestrian traffic and no painted crosswalks for beach access points. | Consideration be given to installing the appropriate painted crosswalks. | X |  |  | X |  |  |
|  | NIGHTTIME FIELD VIEW IDENTIFIED THE FOLLOWING SAFETY ISSUES |  |  |  |  |  |  |  |
| 98 | Northbound side- at S. $33^{\text {rd }}$ Street- crosswalks and related signs are worn | Re-paint crosswalk and replace signs | X |  |  | X |  |  |
| 99 | It has been previously mentioned that the physical left turn slots south of Harbor Beach Boulevard lack the appropriate lane use signs and pavement markings. Without the needed signs it is more difficult to locate the left turn slots during darkness. | Install appropriate lane use control signs. | X |  |  | X |  |  |
| 100 | Northbound side- "NO U TURN" sign south of S.38th Street is worn. | Replace with new sign. | X |  |  | X |  |  |

| SAFETY ISSUE |  | REMEDIAL ACTION | LEVEL OF EFFORT REQUIRED |  |  | POTENTIAL SAFETYBENEFIT |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | LOW | MEDIUM | HIGH | LOW | MEDIUM | HIGH |
| NIGHTTIME FIELD VIEW IDENTIFIED THE FOLLOWING SAFETY ISSUES |  |  |  |  |  |  |  |  |
| 101 | Northbound side- "20 MPH" advisory speed plate installed below circle warning sign is worn. |  | Replace advisory plate. | X |  |  | X |  |  |
| 102 | "KEEP RIGHT" signs facing both of the Brigantine Boulevard (CR 638) approaches at the circle are worn. | Replace both signs. | X |  |  | X |  |  |
| 103 | All "SPEED LIMIT 30" signs along the road are worn. | Replace all "SPEED LIMIT 30" signs. | X |  |  | X |  |  |
| 104 | The red flashing device at the northern end of Brigantine Boulevard (CR 638) flashes alternately. Devices such as this should flash simultaneously. Also, there are no hazard markers supplementing the flashing device. | Revise device to flash simultaneously and install appropriate hazard markers. | X |  |  | X |  |  |
| 105 | Brigantine Boulevard (CR 638) experiences a slight horizontal curve in the vicinity of $3^{\text {rd }}$ Street. While the road curves the pavement markings are installed straight. | Revise pavement markings to follow curve in the road. | X |  |  |  | X |  |
| 106 | Street lights at both of the intersections with the physical pedestrian islands are out. | Contact the appropriate authority to address lighting. | X |  |  |  | X |  |

## Recommendations

As stated earlier, the intent of the road safety assessment process is to conduct a formal examination of highway features and the surrounding environment that increase the potential for crashes and identify countermeasures that will reduce (or eliminate) the probability of such crashes. The safety issues identified during the conduct of this assessment and included in this report have been organized to provide the convenience and flexibility necessary to allow the implementation of the safety improvements as time and budget limitations allow. To the extent possible, the findings have been separated into line items so that the improvements can be implemented independently as appropriate. Clearly, consolidating a number of the safety recommendations will reduce the overall cost of improvements. We recommend that the appropriate management staff review the findings and decide which items can be completed in the immediate future (within one year). Many of the deficiencies can be corrected in the short term if the roadway owners dedicate both the time and financial resources to the task. The Level of Effort (an estimate of expenditures and man hours) indicated on the finding sheets of the report represent the team's best effort at categorizing each item.

The findings of the report with the greatest potential for reducing the crash experience along the road appear to be the upgrading of the traffic signals and related recommendations described in Item \#17 (The relocation of the pedestrian crossing across Brigantine Boulevard (CR 638) and the other signal upgrades at the intersection of Brigantine Boulevard with Harbor Beach Boulevard), Item \#26 (The upgrading of the traffic signal installation at South $38^{\text {th }}$ Street) and Item \#48 (The upgrading of the traffic signal installation at the intersection of South $14^{\text {th }}$ Street). The extent of the necessary revisions to the traffic signal in conjunction with the need to relocate the pedestrian crosswalk across Brigantine Boulevard (CR 638) at Harbor Beach Boulevard (Item 17) probably justifies the installation of a complete new signal installation at that intersection.

Implementing Items \#1 (Re-installing the pavement markings along the entire road), \#2 (Repairing or replacing the RPM's along the entire road), \#3 (Repairing the pavement along the section of road between Harbor Beach Boulevard and its southern terminus),
and \#5 (addressing the method of sign installation along the entire road) which are all general comments would significantly contribute to the over all safe operation of the road. As noted in Item \#6, the street name signs are old and faded. They are difficult to read, especially at night. Motorist indecision and subsequent erratic maneuvers could be significantly reduced if new street name signs with letter sizes in accordance with the MUTCD were installed throughout the corridor. Item \# 31 (long term improvements to the circle) should also be given serious consideration. Bicycle safe inlet grates and periodic tree trimming over the bike lane would enhance bicycle safety throughout the corridor.

Unfortunately, with many roads and many of the assessments we have conducted, there is no easy quick-fix solution to many of the crash patterns. While the safety assessment focuses on roadway features, enforcement is still a crucial component of safety on a road. Enforcement discourages the motorist from becoming lax in obeying or observing the traffic regulations along the road. Just as resources must be allocated to the physical improvements of the road, they must also be allocated to enforcement to maintain the safe operation of the road.

The opinions found in the findings of this Safety Assessment report are those of the Safety Assessment Team, as a whole, and not necessarily the opinions of the SJTPO or the individual team members.
